Report: Investigating Kaggle Olympic Dataset

Yasir Din

4 □ > 4 ⓓ > 4 ≧ > 4 ≧ > ...

Introduction

The work presented here comprises my investigation of the Kaggle dataset: "120 years of Olympic history: athletes and results". Insights and observations are (roughly) presented in the order I discovered them. Starting with macroscopic observations related to the whole dataset; the investigation gradually moves to more detailed insights focusing on a couple of key questions.

Technologies used:

- Python 3.7 (pandas, Matplotlib, seaborn, NumPy)
- Jupyter Notebook

Git Repository:

https://github.com/yasirdin/kaggle-olympic

Dataset:

https://www.kaggle.com/heesoo37/

Initial Observations

- Intr
- ► The Olympics
 - The Summer Olympics started in 1896, and the Winter Olympics in 1924.
 - Until 1992, the Summer and Winter Games were held on the same year. Since then, they have been held on the same 4 year cycle but 2 years apart where: Winter started in 1994 and Summer in 1996.
- pandas.DataFrame.info shows missing data in dataset:
 - Height,
 - Weight,
 - Age.
- Interesting pandas.DataFrame.describe outputs:
 - Average athlete age = 26 years;
 - ► Oldest athlete = 97 years!
 - Youngest athlete = 10 years!
 - Average weight = 71 kg;
 - Average height = 171 cm.

Missing Data (Age)

Left y-axis: percentage of athletes with age data, and right y-axis: raw count of athletes with age data.

Result:

Following 1960, age data for almost all athletes exists (with very few exceptions). Missing data isn't bad overall so drawing rough age statistics from the whole dataset should be fine, however for any detailed analysis $year \geq 1960$ should be taken.

Missing Data (Height & Weight)

This result was acquired by grouping the dataset by Region and not Country, so as to include historical changes i.e. Russia == Soviet Union, West / East Germany == Germany, etc.

Thoughts:

USA, Russia and Germany are large countries with high participation in the Olympics. How does this result look when normalised for number of entrants? Let's investigate further... Report: Investigating Kaggle Olympic

         Name: Event, dtype: int64
```

Thoughts:

Aha! The medals have been counted for whole teams. So in 1956, all 14 players in the hockey team received a medal. This explains the result we saw earlier!

Now, can we find a way to prevent this by: counting all team events as only 1 medal? (Instead of 13 - 16 in the case of hockey!)

Report: Investigating Kaggle Olympic Dataset

Yasir Din

Pakistani Medalists

Counting Team Events as 1 Medal

Code to achieve this:

Pakistan Medals after implementing new medal counting system (now correct!):

	Bronze	Silver	Gold	total	
Pakistan	4.0	3.0	3.0	10.0	.0

Result:

The new counting system now counts winning teams as 1 medal, as demonstrated with the Pakistan example. After applying this, what do the top 20 countries look like now?

Result:

Correcting medal count for team events hasn't had a large effect on the standings. Since all of these team, by virtue of being on top, will participate in roughly the same amount of team events. One exception is China, who has moved up 5 positions (because of relatively more individual events).

Most Successful Olympians

Here are the most successful Olympians of all time:

	region	Sport	Bronze	Gold	Silver	total_medals	total_events	medals_per_event
Name								
Michael Fred Phelps, II	USA	Swimming	2.0	23.0	3.0	28.0	30.0	0.933333
Larysa Semenivna Latynina (Diriy-)	Russia	Gymnastics	4.0	9.0	5.0	18.0	19.0	0.947368
Nikolay Yefimovich Andrianov	Russia	Gymnastics	3.0	7.0	5.0	15.0	24.0	0.625000
Edoardo Mangiarotti	Italy	Fencing	2.0	6.0	5.0	13.0	14.0	0.928571
Borys Anfiyanovych Shakhlin	Russia	Gymnastics	2.0	7.0	4.0	13.0	24.0	0.541667
Ole Einar Bjrndalen	Norway	Biathlon	1.0	8.0	4.0	13.0	27.0	0.481481
Takashi Ono	Japan	Gymnastics	4.0	5.0	4.0	13.0	33.0	0.393939
Dara Grace Torres (-Hoffman, -Minas)	USA	Swimming	4.0	4.0	4.0	12.0	13.0	0.923077
Jennifer Elisabeth "Jenny" Thompson (-Cumpelik)	USA	Swimming	1.0	8.0	3.0	12.0	17.0	0.705882
Sawao Kato	Japan	Gymnastics	1.0	8.0	3.0	12.0	24.0	0.500000
Aleksey Yuryevich Nemov	Russia	Gymnastics	6.0	4.0	2.0	12.0	21.0	0.571429
Birgit Fischer-Schmidt	Germany	Canoeing	NaN	8.0	4.0	12.0	13.0	0.923077
Ryan Steven Lochte	USA	Swimming	3.0	6.0	3.0	12.0	14.0	0.857143

This result was obtained by grouping by Name, Region, Sport, and counting the number of medal wins. Then, medals_per_events was added to measure their medal conversion rate.

Thoughts:

An remarkably high strike rate for Michael Phelps and Larysa Semenivna Latynina; they each win a medal $\sim 94\%$ of the time they compete in an event, with Phelps winning 23 golds out of 28 medals overall!

Male & Female Participation

Historical participation of males and females, with female/male:

Thoughts:

The number of females per male has gradually been increasing since the Olympics started (currently at 0.8 females per male — almost 1!). There are two bumps in female/male: one between 1920-1940 and one between 1950-1960. These could have happened as a result of the wars, whereby men will have either died, or been left too injured to compete.

Results:

- ▶ Up until ~ 1960 there is a lot of spread variation in the ages of Olympians, as demonstrated by the standard deviation plots on the previous slide. This must be caused, in part, by the missing data we identified earlier — all of which also stabilises around 1960.
- Looking at the box plots, there occurs a sudden shift towards older ages at year 1932. Why could this be? Studying the data further, it's because of the inclusion of art competitions in the olympics (result below).

Let's look further into these art competitions...

Cyclist Weight

Cyclist weight differs drastically depending on the discipline. With track cyclists generally being more heavier and powerful, and road cyclists more lighter and geared for endurance. Let's see how the average weight of Men's Road Race (road), and Men' Sprint (track) have varied over time:

Thoughts:

Unsurprisingly, road cyclists have remained relatively light. Whilst, track cyclists have gotten gradually heavier over time. The next slide compares the two physiques...
